Importance of Deep Breathing. Nervousness can be cured by forming the habit of breathing deep and long, and one medical authority prescribes it in his schedules for nervous women. All singers are invariably high-chested and free from colds or chronic coughing spells. It is because they have learned to breathe from the waist instead of the top of the lungs, as the majority of people do. To breathe deeply is to stimulate the heart and circulation. It means a full, high chest, and broad shoulders. It means practical immunity from the dangers incurred by exposure. It means a good carriage and well-poised fect physical health

The Greatest Historian.

By common consent the greatest of all historians is Thucydides, the Greek, contemporary of Pericles and author of the history of the Peloponnesian War. One of the greatest tributes that can be paid to him is that according to the estimate of a very able critic, we have a more exact account of a long and eventful period by Thucydides than we have of any period in modern history, equally long and eventful, and yet all this is compressed into a single volume. For concise, vigorous and yet intense presentation Thucydides has never been equalled. He is easily the king of historians.

The Lightning of Vesuvius. Among the remarkable phenomena connected with the great eruption of Vesuvius in April, 1906, Professor Matteucci, in a recent report to the Italian Geological Society, mentions the electric discharges in the huge column of smoke, gas and steam that rose, swaying with the wind, thou sands of feet above the crater. Many discharges took place between the column of smoke and the earth, and these are described as having been of extraordinary intensity. The greatest measured height of the column during the eruption was about 42,600 feet, or in round numbers 8 miles.

Ingenious Device to Outwit the En-

terprising Burglar.

Since no metal has yet been devised which can resist the action of the oxyhydrogen or the oxyacetylene flame, it became necessary to find some other means of keeping burglars from safes and strong boxes, so the revolving safe has been evolved. It consists of a steel box inclosed on all sides and arranged to revolve on ball bearings, and inclosed in a spherical compartment, built of strong masonry and closed. In the inclosing masonry and in the strong-box doors are contrived, by means of which the strong box is accessible from outside, as long as it is not revolving, which would be the case, for instance, during the business hours of the bank in whose quarters the revolving safe is set up. At the close of business both doors are closed, an electromotor, operated by a storage battery, is switched on and the strong-box then revolves at a uniform rate of speed uninterruptedly until a predetermined period, to which a clockwork connected with the switching apparatus is set, when the moving mechanism is automatically
